Steps to Create subtheme of bootstrap in drupal

Step 1: First install the bootstrap theme in drupal by going to administrator -> Appearence and we no need to enable it.

Step 2: Then install and enable jQuery update module and set the "Default jQuery Version" to 1.9 in current subtheme settings.

Step 3: Create a folder for subtheme inside of sites/all/themes for example in our case we will have the directory structure as sites/all/themes/bootstrap_subtheme

Step 4: Copy all the files to "sites/all/themes/bootstrap_subtheme" from sites/all/themes/bootstrap/docs/subtheme

Step 5: Copy over one of the starterkits from the "/bootstrap/starterkits" folder into "sites/all/themes/bootstrap_subtheme"

Step 6: Rename `./bootstrap_subtheme/cdn.starterkit` or, if using the LESS Starterkit, "./bootstrap_subtheme/less.starterkit" to match the folder name and append `.info` (e.g. "./subtheme/bootstrap_subtheme.info").

Step 7: Open `./subtheme/subtheme.info` and change the name, description and any other properties to suite your needs.

Step 8: Now we can see our subtheme in the appearence option of administrator menu and finally just enable the subtheme.
